Use ABAP Cloud for developer extensibility – DT182v

Andre Fischer, Harish Bokkasam – SAP SE
November 3, 2023

Agenda

INTRODUCTION

TODAY'S SCENARIO – OVERVIEW

TODAY'S SCENARIO – EXERCISES

WRAP UP

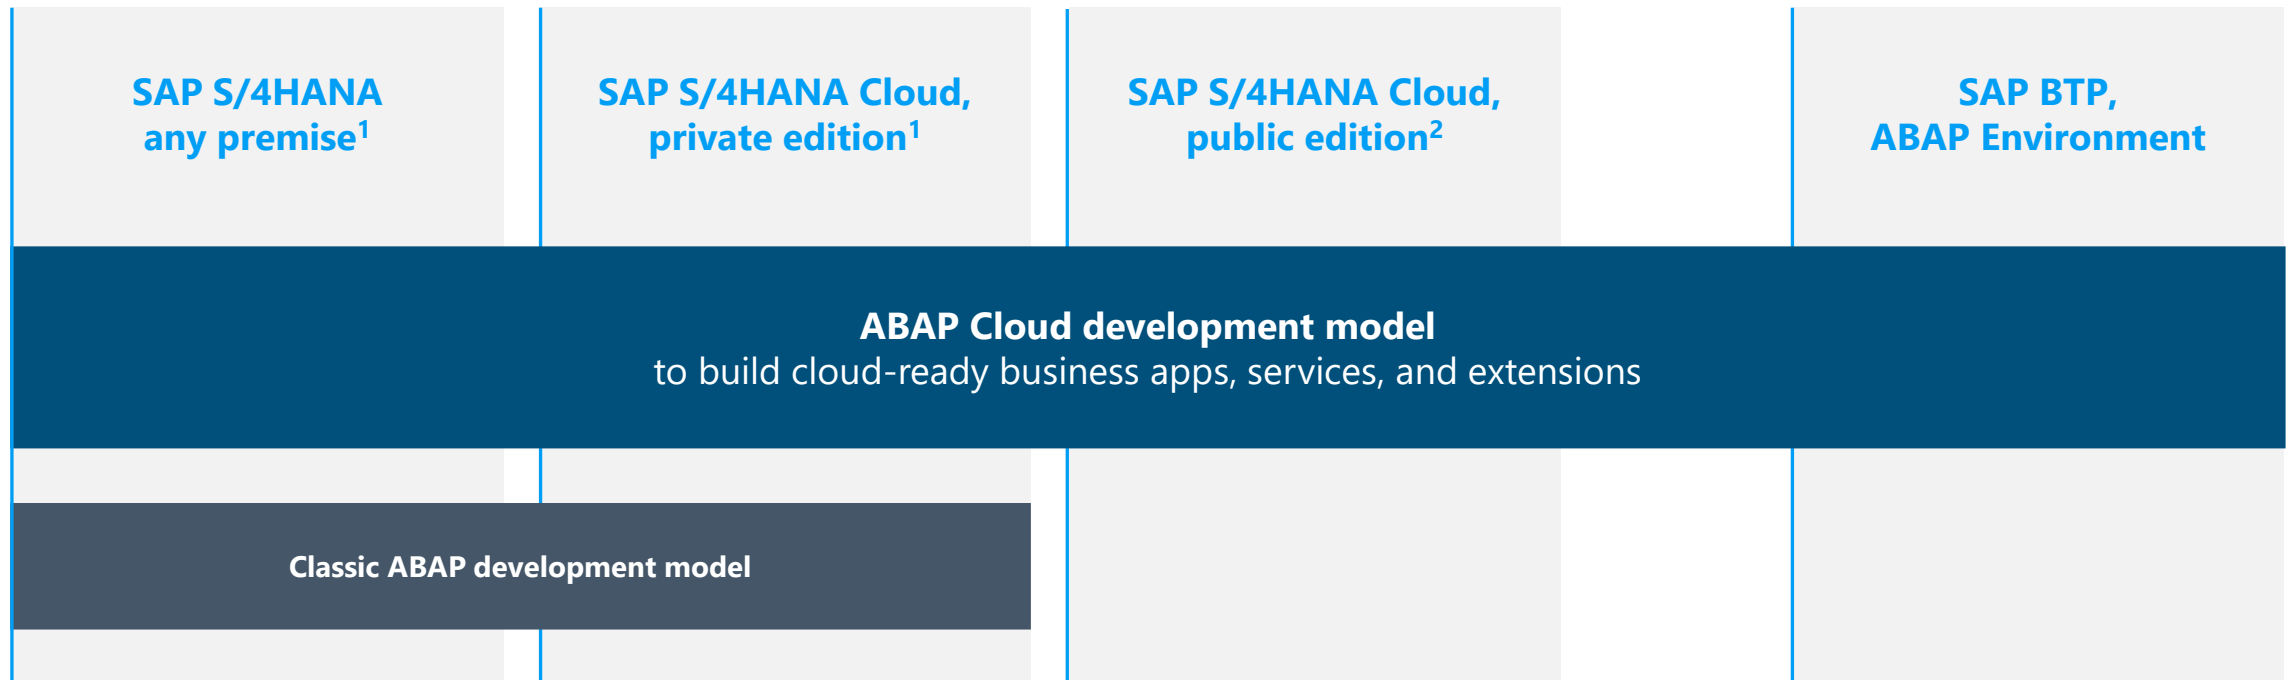

INTRODUCTION

ABAP Cloud

- ... is the ABAP **development model** to build cloud-ready business apps, services, and extensions
- ... comes with SAP Business Technology Platform (SAP BTP) and SAP S/4HANA
- ... works with public or private cloud, and even on-premise

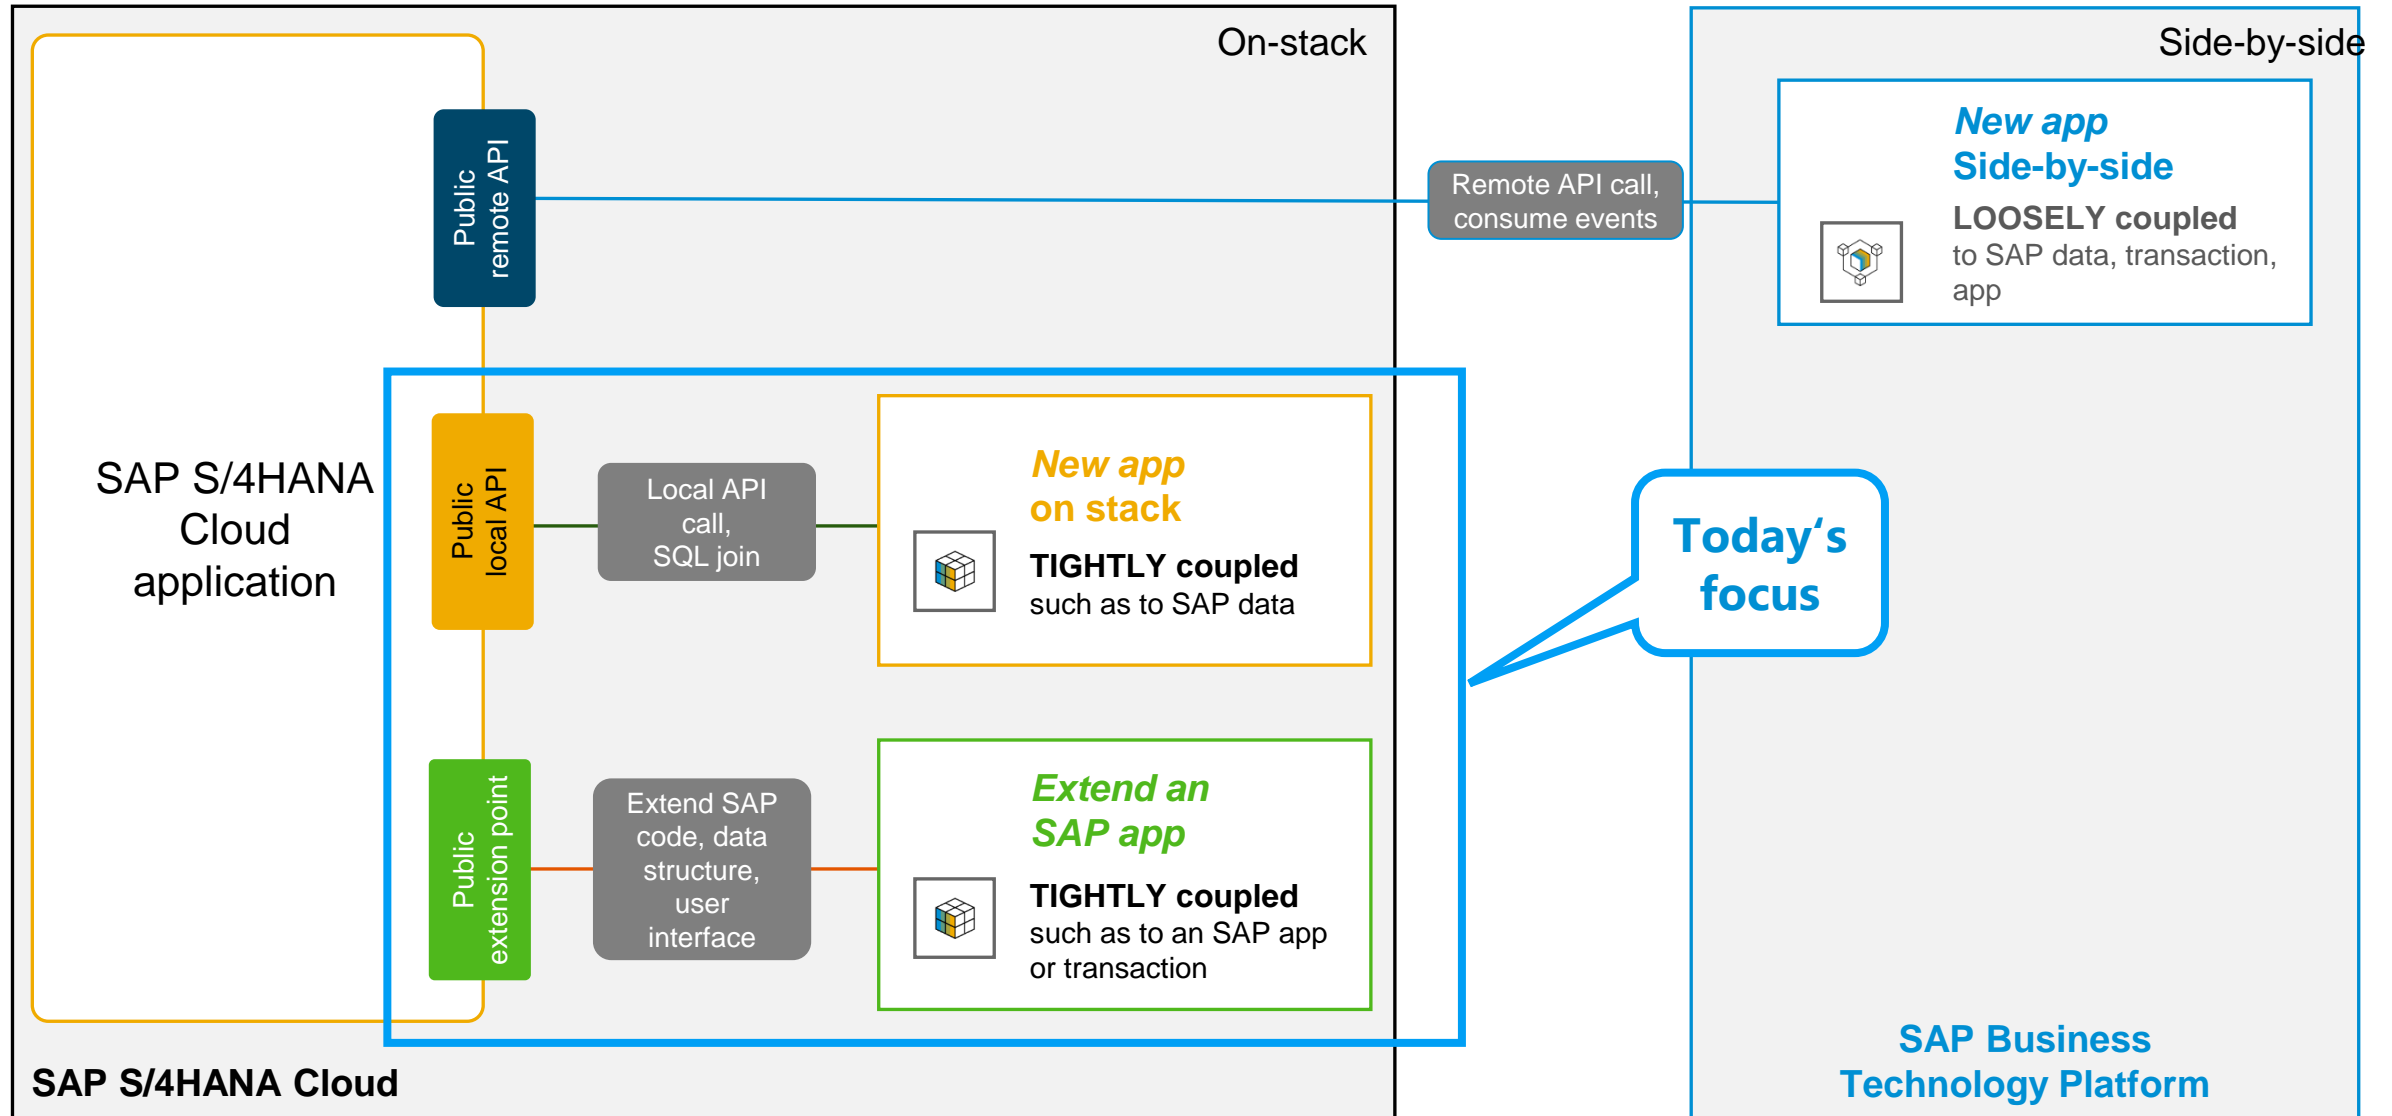

ABAP Cloud – One development model for SAP S/4HANA and SAP BTP

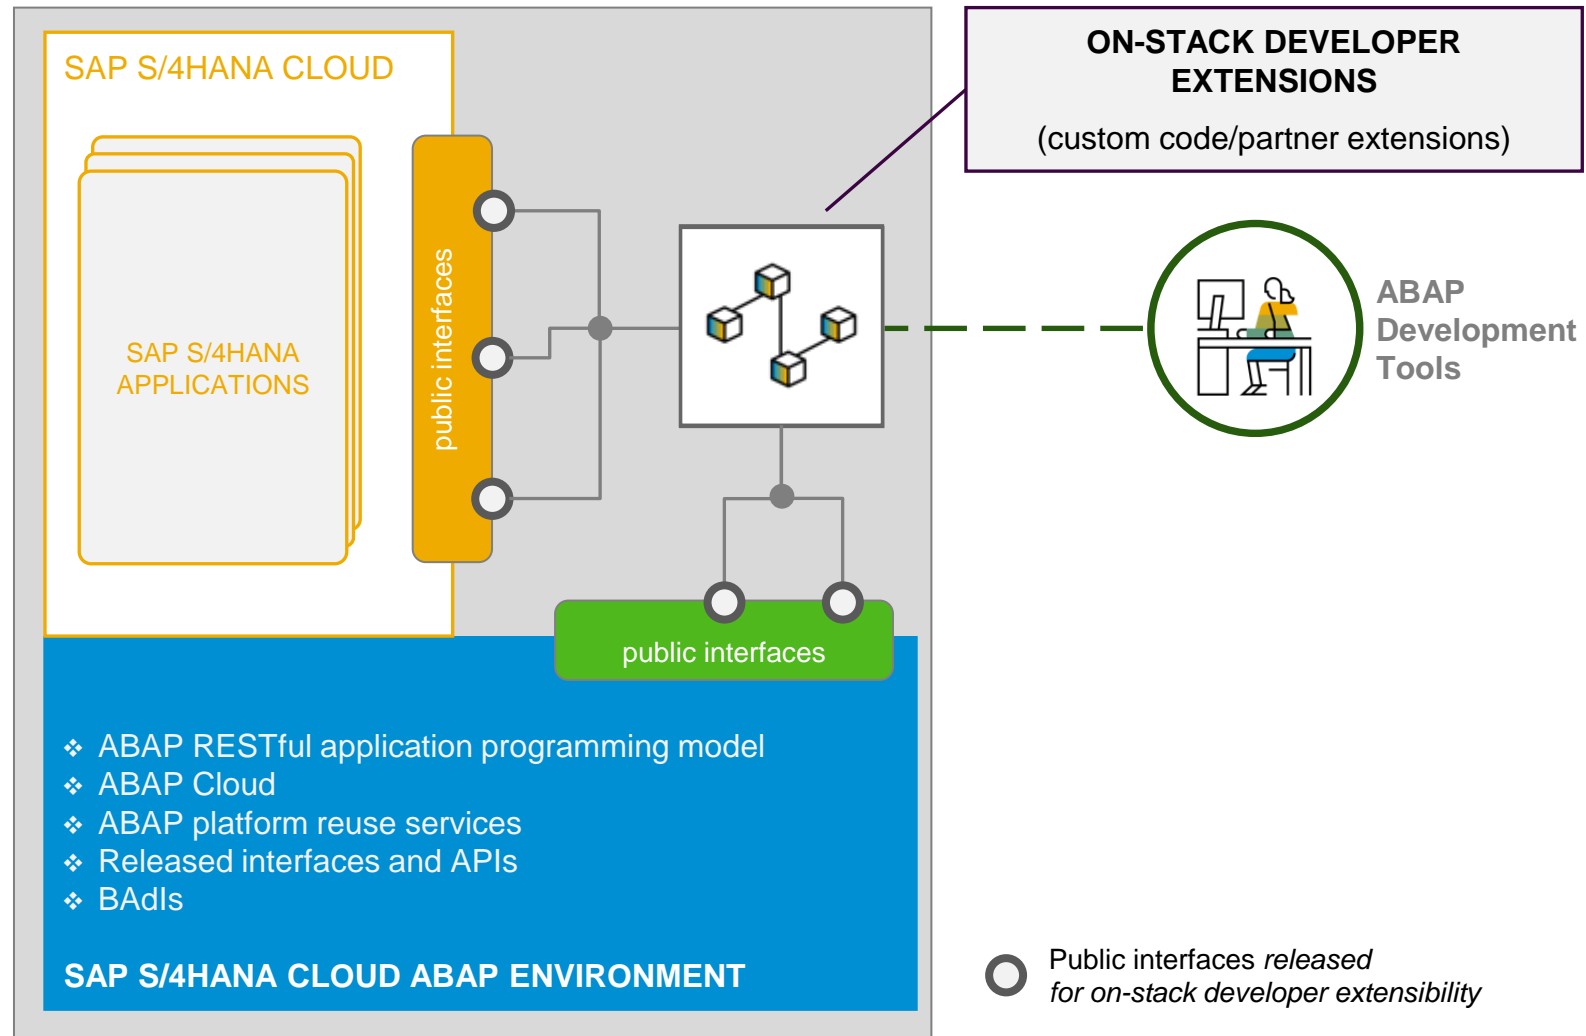

¹ SAP S/4HANA any premise or SAP S/4HANA Cloud, private edition release \geq 2022

² SAP S/4HANA Cloud, public edition release \geq 2208, 3-system landscape required

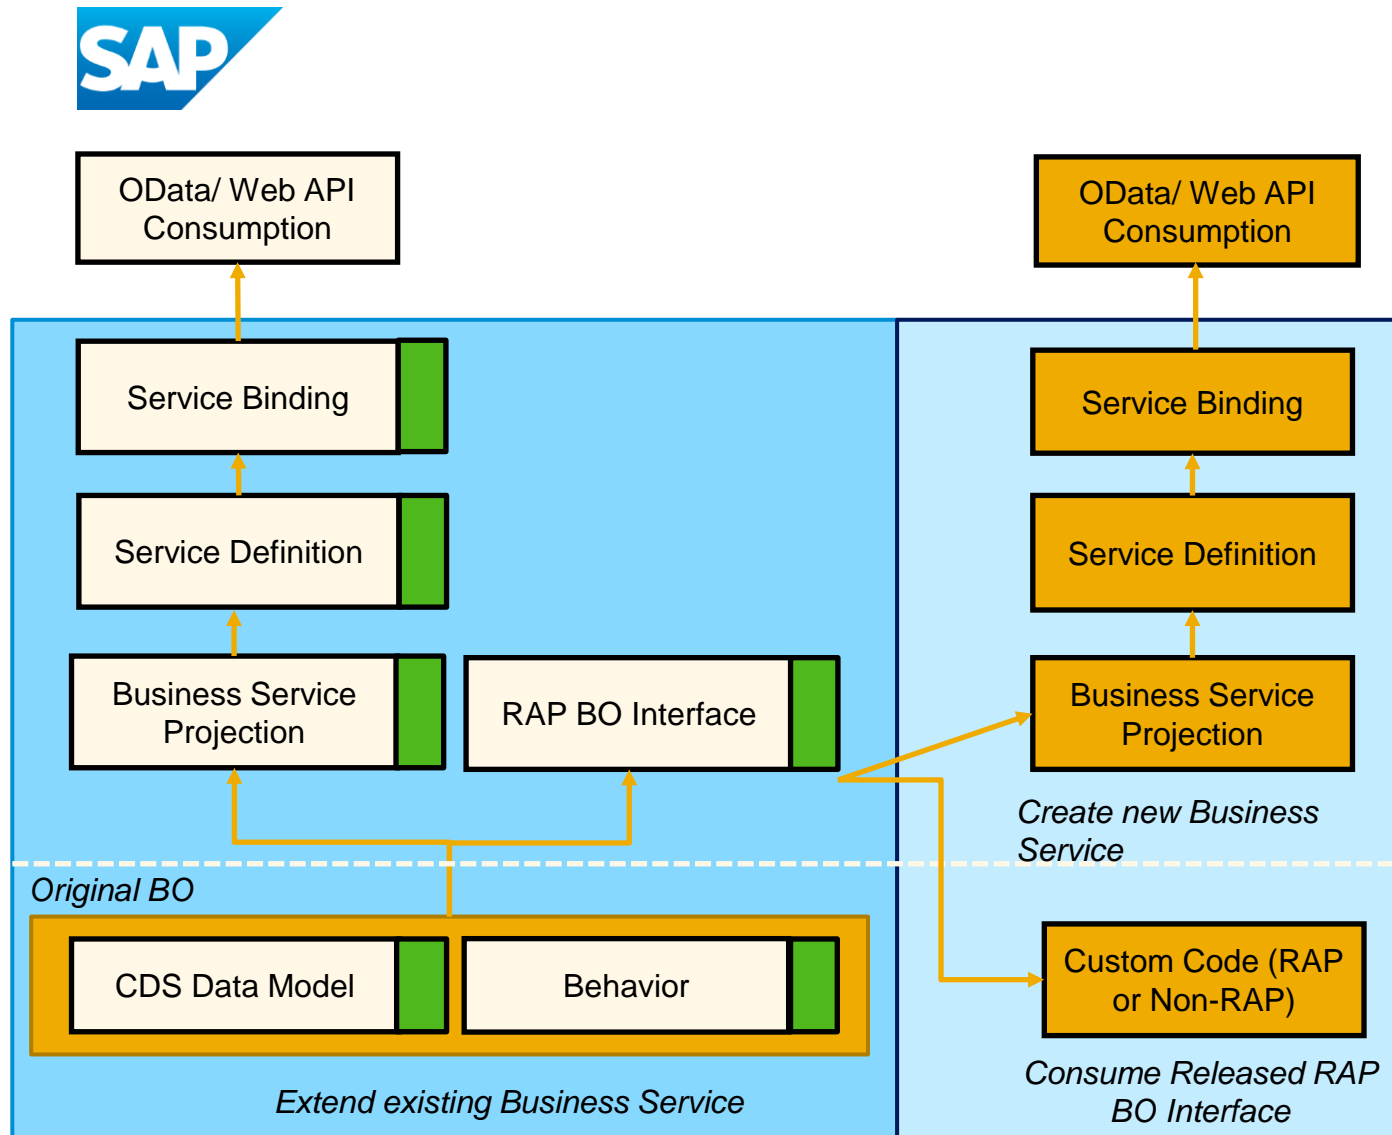

SAP S/4HANA Cloud extensibility patterns

New app on stack and SAP app extension

ON-STACK DEVELOPER EXTENSION OPTIONS

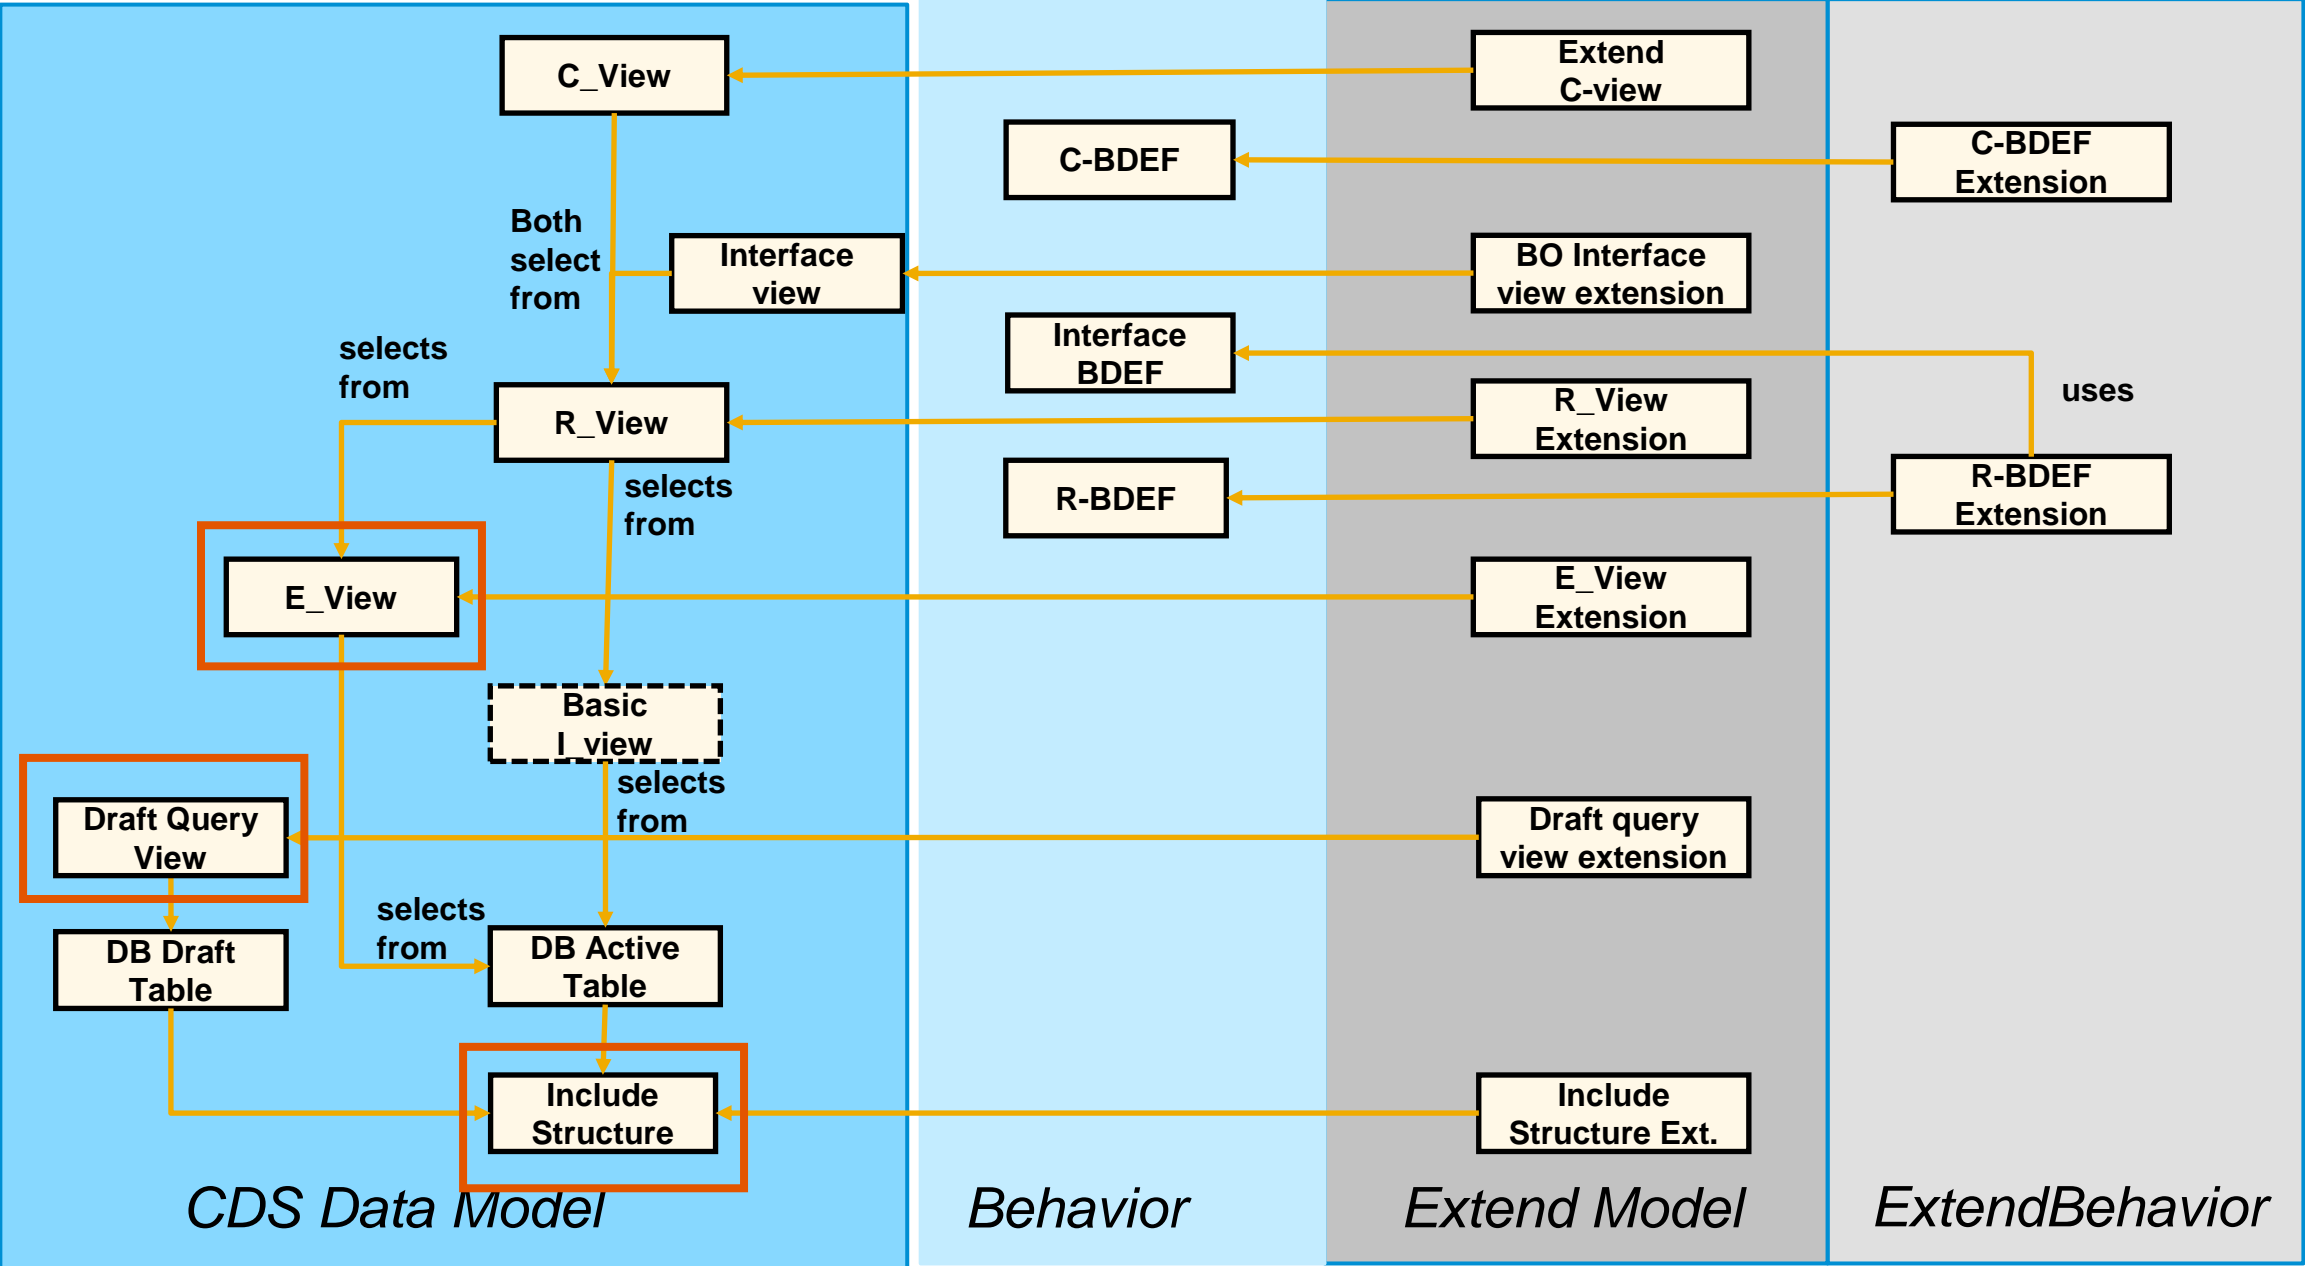

- Create new BO's on top of released BO interfaces
- Consume released BO interfaces in custom code
- Extend existing BO's

→ = **New app on stack**

■ = **Extension**

RAP business object extension in detail

TODAY'S SCENARIO – OVERVIEW

Extended Onlineshop App – Behavior extension

Add e.g. side effects

Standard   

Search  Editing Status: All  OrderID:  OrderedItem:  CurrencyCode: 

 Adapt Filters (1)

TODAY'S SCENARIO – EXERCISES

Generate your own extensible RAP BO

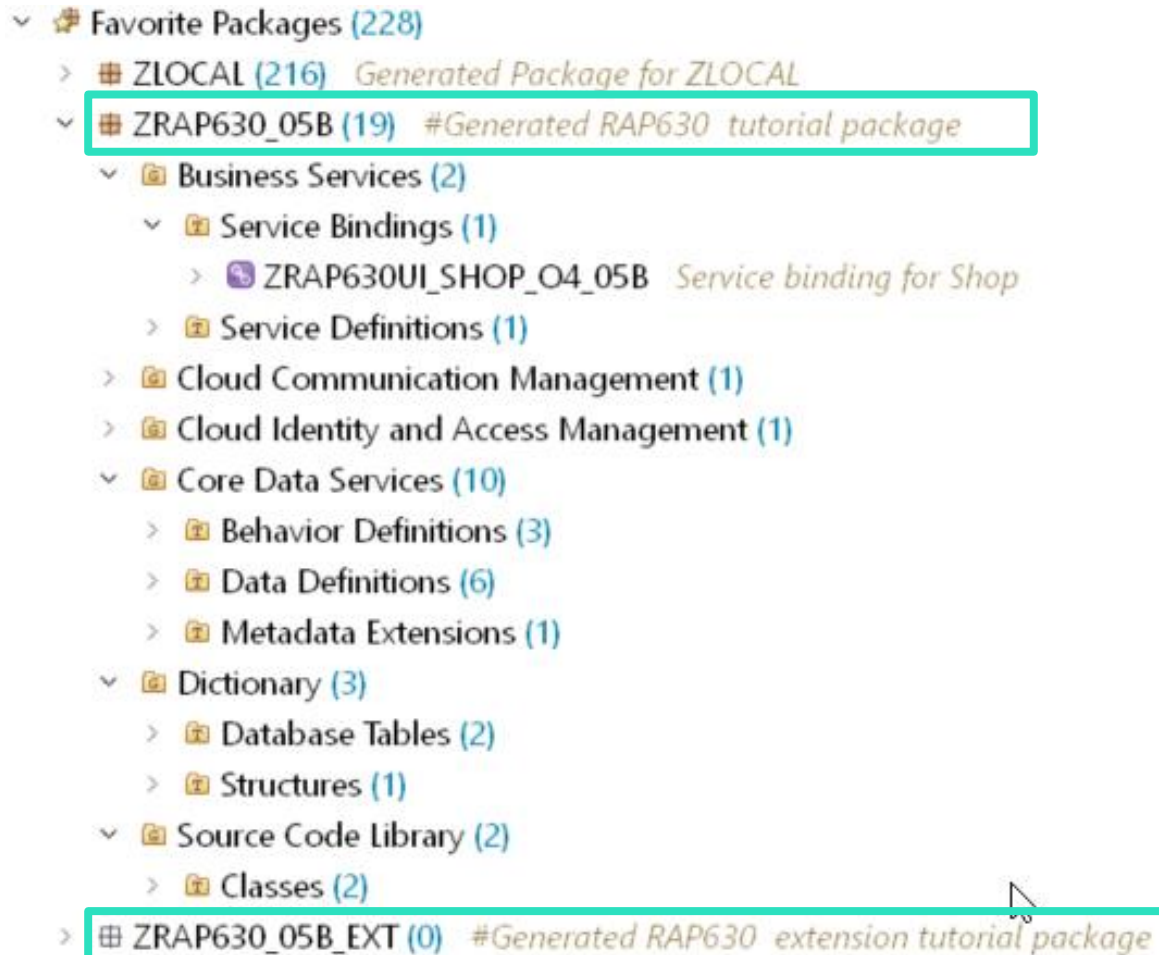

Run ZDMO_GEN_RAP630_SINGLE via F9

The screenshot shows the SAP IDE interface. In the Project Explorer, the package `ZDMO_GEN_RAP630_SINGLE` is selected under `Favorite Objects (1)`. A right-click context menu is open, and the `Run As` option is selected. The `Run As` submenu is also open, showing four options: `1 ABAP Application (Console)` (F9), `2 ABAP Test Cockpit` (Ctrl+Shift+F2), `3 ABAP Test Cockpit With...`, and `4 ABAP Unit Test` (Ctrl+Shift+F10). A callout box points to the `Run As` option with the text "Run as console application F9".

Below the context menu, the ABAP Console window is visible, displaying the output of the `ZDMO_GEN_RAP630_SINGLE` program:

```
RAP630 exercise generator
-----
Use transport TECK900021
Info: Suffix "05B" will be used.
The following packages got created for you and will include everything you need:
- "ZRAP630_05B" and
- "ZRAP630_05B_EXT"
In the "Project Explorer" right click on "Favorite Packages" and click on "Add Package...".
Select both (!) packages "ZRAP630_05B" and ZRAP630_05B_EXT and click OK.
The generation process has been started asynchronously in the backend
and it will take some minutes to complete.
```

Use ABAP Cloud for developer extensibility

Two packages have been generated:

- ZRAP630_###
Base BO
- ZRAP630_###_EXT
Extension objects

☰ README.md

DT182v - Use ABAP Cloud for developer extensibility

Description

This repository contains the material for the SAP TechEd 2023 session called *DT182v - Use ABAP Cloud for developer extensibility*.

Developer extensibility as defined by SAP basically encompasses two activities

1. Develop custom code to implement your own business logic. Here you can make use of existing API's from SAP that have been released for that purpose.
2. Extend an existing RAP Business Object delivered by SAP so that additional business functionality is added. Such an extensible RAP business object will usually reside in another software components or it is an existing SAP delivered RAP BO that is extensible. Both can be optimized and their functionality can be adapted to your specific business requirements.

Overview

This session introduces attendees to the ABAP Cloud programming model and how this can be leveraged to build extensions (own code) in SAP S/4HANA BTP, ABAP Environment or how you can extend an existing RAP Business Object using the ABAP Cloud programming model.

01

Access to the exercises:

<https://github.com/SAP-samples/teched2023-DT182v>

02

Set up your development environment.

1. [Install and set up your ABAP Development Tools for Eclipse](#)
2. [Create an SAP BTP ABAP Environment Trial User](#)
3. [Create an ABAP Cloud Project](#)

03

Move at your own speed!

04

Feel free to ask questions via GitHub issues!

► Provide screenshots to facilitate the support

The DT182v hands-on exercises – Working on GitHub (1)

Follow the step-by-step instructions provided on [GitHub](#).

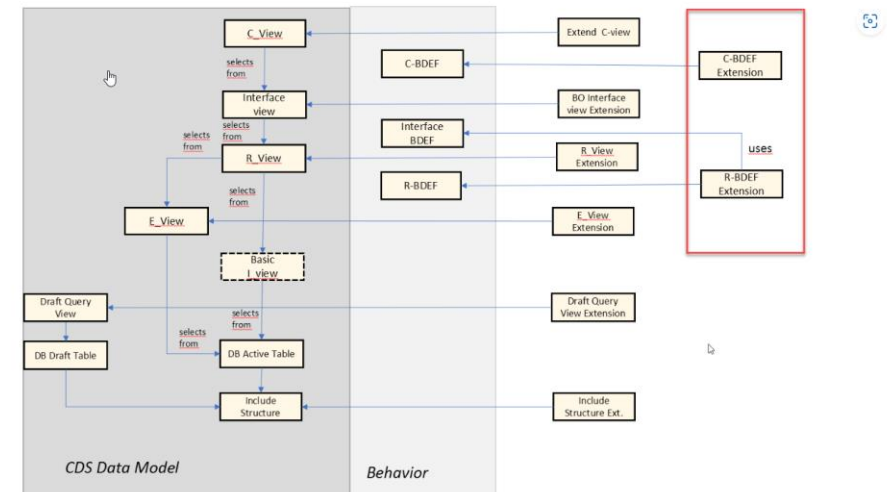

- [Getting Started](#)
- [Exercise 1 - Consume a released RAP BO](#)
- [Exercise 2 - Extend the behavior \(determinations, valid](#)
- [Exercise 3 - Extend the data model \(add additional fiel](#)
- [Exercise 4 - Extend the behavior \(add an action\)](#)

teched2023-DT182v / exercises / ex2 /

Exercise 2 - Behavior extension

In this exercise, we will extend the behavior of an extensible RAP BO. That means we will add a validation, a determination and side-effects to the behavior of the RAP BO by using an extension.

Since extending a RAP BO in parallel by several developers can cause severe problems every participant will work with his or her own base RAP BO. For your convenience an extensible RAP BO has thus been generated using the class `zdemo_gen_rap630_single` that you have run in the [Getting started](#) section.

Exercise 2.1 Extend the behavior definition with a validation

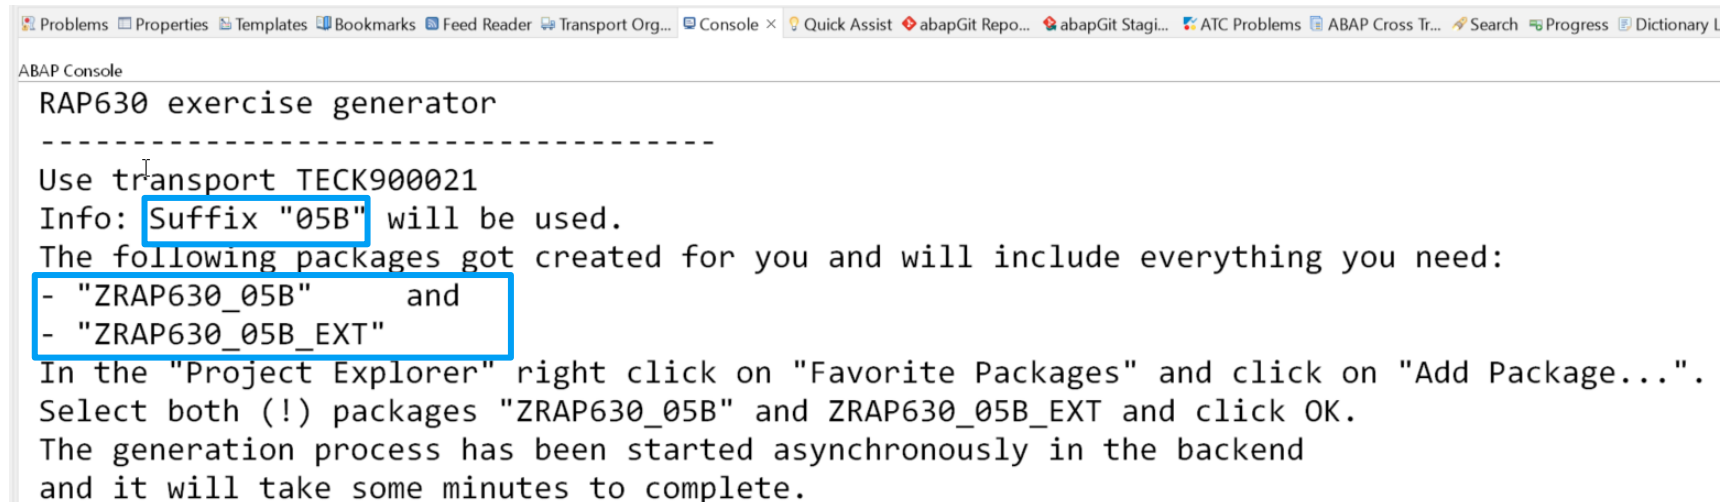

After completing these steps you will have created a validation to check the delivery date.

SUMMARY

Key takeaways

ABAP Cloud is the development model provided to build cloud-ready enterprise services, apps, and extensions on SAP BTP ABAP environment and all editions¹ of SAP S/4HANA, in the cloud and on-premises.

The **ABAP RESTful application programming model** (RAP) is at the **heart of ABAP Cloud** for efficiently building **transactional** OData-based services and SAP Fiori apps with built-in cloud qualities.

RAP best support **SAP HANA** and **SAP Fiori elements**.

RAP is available on **SAP BTP ABAP Environment**, **SAP S/4HANA Cloud**, and **SAP S/4HANA** as of edition 1909.

The **RAP feature set** is enhanced **quarterly** in SAP BTP ABAP environment, **twice a year** in SAP S/4HANA Cloud, and **every two years** in SAP S/4HANA and SAP S/4HANA Cloud, private edition.

What's New: [SAP BTP ABAP environment](#) | [SAP S/4HANA](#) | [SAP S/4HANA Cloud](#)

What's Next: [ABAP Platform Roadmap Information](#) for all SAP products

¹ SAP S/4HANA any premise or SAP S/4HANA Cloud, private edition release ≥ 2022
SAP S/4HANA Cloud, public edition release ≥ 2208, 3-system landscape required

Thank you

APPENDIX

COMPACT GLOSSARY

About some of the used RAP features – Compact Glossary

→ BACK TO MAIN
PRESENTATION

UI Semantics with CDS Annotations

Various UI-specific CDS annotations can be used to solve the most common UI layout tasks in SAP Fiori elements apps built with RAP. UI annotations represent semantic views on business data through the use of specific patterns that are independent of UI technologies. For more information, see [Develop UI Specifics](#) | [CDS Annotations](#) | [SAP Fiori elements Showcase App for RAP And ABAP CDS](#).

Support for Large Objects (aka OData Streams)

You can enable your RAP application for maintaining large objects (LOBs). By doing so, you provide end users the option to incorporate external binary files or text files when editing entity instances. For more information, see [Working with Large Objects](#)

Virtual Elements in CDS Projection Views

Virtual elements represent transient fields in business applications. They are used to define additional CDS elements that are not persisted on the database, but calculated during runtime using ABAP classes that implement the virtual element interface. They are defined at the level of CDS projection views as additional elements within the SELECT list. For more information, see [Virtual Elements](#).

About some of the used RAP features – Compact Glossary (2)

→ BACK TO MAIN
PRESENTATION

Late Numbering

Numbering is the process of setting values for primary key fields of entity instances during runtime. Early and late numbering are supported in RAP. In a **late numbering** scenario, the key values are always assigned internally without consumer interaction after the point of no return in the interaction phase has passed, and the SAVE sequence is triggered. For more information, see [Numbering](#).

Validations

Validations are used to ensure the data consistency. Back-end are defined in the BO behavior definitions and implemented in the respective behavior implementation classes. Front-end validations are used to improve the user experience by providing faster feedback and avoiding unnecessary roundtrips. They can be defined in the BO data model using value helps. For more information, see [Validations](#).

Determinations

A determination is an optional part of the business object behavior that modifies instances of business objects based on trigger conditions. A determination is implicitly invoked by the RAP framework if the trigger condition of the determination is fulfilled. Trigger conditions can be modify operations and modified fields. A determination can be triggered on modify or on save. For more information, see [Determinations](#).
